REQUIREMENT ANALYSIS DOCUMENT

NAILVERSE

Not just NAILS.. IT's the WHOLE MOOD

Online Nail Art & Nail Beauty Online Platform

WEEK - 1

---

1. Requirement Analysis

Understanding the Nailverse Business

Nailverse is an online nail-care booking platform that connects customers with nail technicians for services such as manicures, pedicures, nail art, and nail extensions. Below is a structured breakdown of the business process, customer data requirements, and entity definitions for system design and database modeling.

The Process Flow:

- Browse / Search Services: The customer searches for the nail service they want (e.g. gel manicure, acrylic extension, nail art).
- Select Technician & Slot: After choosing the service, the customer picks a preferred technician and an available time slot.
- Appointment Booked: The customer confirms the salon location (or home-service address) and books the appointment.
- Checkout / Payment: After booking, the system moves the customer to the payment section, then to the checkout process.
- Service Delivery: On the scheduled date, the technician performs the nail service for the customer.
- Review & Support: After the service is completed, the customer may leave a review and rating. For issues such as damage, refunds, or rebooking, the customer can raise a support request.

Browse / Search Services → Select Technician & Slot → Appointment Booked → Checkout / Payment → Service Delivery → Review & Support

Entities:

Entity	Description	Key Attributes	Key Relationships
Customer	End-user who browses services and books nail appointments.	customer_id (PK), first_name, last_name, email, phone, created_at	One-to-Many with Appointment, Review

Technician	Nail artist/technician who performs the services.	technician_id (PK), first_name, last_name, email, phone, specialty, rating	One-to-Many with Appointment
Service	A nail service offered by the salon (e.g. manicure, pedicure, nail art).	service_id (PK), name, description, price, duration_minutes, category	Many-to-One with Technician (default), Many-to-Many with Appointment (via AppointmentService)
Appointment	Booking instance representing a customer's scheduled visit.	appointment_id (PK), customer_id (FK), technician_id (FK), appointment_date, status (booked, completed, cancelled), total_amount	Many-to-One with Customer, Many-to-One with Technician, One-to-One with Payment, Many-to-Many with Service (via AppointmentService)
Payment	Monetary transaction tied to an appointment.	payment_id (PK), appointment_id (FK), payment_method (cash, card, UPI), status (success, failed, refunded), transaction_id, amount, payment_date	One-to-One with Appointment
Review	Feedback and rating submitted by a customer for a service/technician.	review_id (PK), customer_id (FK), technician_id (FK), rating (1-5), comment, created_at	Many-to-One with Customer, Many-to-One with Technician

Customer Table Creation:

```
SQL> create table customer(customer_id varchar2(20) Primary key, first_name varchar2(20),
  2  last_name varchar2(20), email varchar2(30), phone number(10), created_at date);

Table created.

SQL> desc customer
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 CUSTOMER_ID                               NOT NULL VARCHAR2(20)
 FIRST_NAME                                         VARCHAR2(20)
 LAST_NAME                                          VARCHAR2(20)
 EMAIL                                              VARCHAR2(30)
 PHONE                                              NUMBER(10)
 CREATED_AT                                         DATE
```

Insert Values:

```
SQL> INSERT INTO customer
  2  VALUES ('CU-1001', 'MEERA', 'IYER', 'meeraiyer@nailverse.com', 9876543210, TO_DATE('2023-02-14', 'YYYY-MM-DD'));
```

Using Substitution Variables:

```
SQL> INSERT INTO customer
  2  VALUES ('C-100
  3
SQL> INSERT INTO customer (customer_id, first_name, last_name, email, phone, created_at)
  2  VALUES (
  3  '&cust_id',
  4  '&first_name',
  5  '&last_name',
  6  '&email',
  7  &phone_num,
  8  DATE '&created_date'
  9  );
Enter value for cust_id: C-1002
old   3: '&cust_id',
new   3: 'C-1002',
Enter value for first_name: KAVYA
old   4: '&first_name',
new   4: 'KAVYA',
Enter value for last_name: RAO
old   5: '&last_name',
new   5: 'RAO',
Enter value for email: kavya.rao@gmail.com
old   6: '&email',
new   6: 'kavya.rao@gmail.com',
Enter value for phone_num: 8765432109
old   7: &phone_num,
new   7: 8765432109,
Enter value for created_date: 2024-09-23
old   8: DATE '&created_date'
new   8: DATE '2024-09-23'

1 row created.
```

Like this we can create as many rows we want.

Viewing the Data:

```
SQL> select*from customer;

CUSTOMER_ID          FIRST_NAME           LAST_NAME
-------------------- -------------------- --------------------
EMAIL                               PHONE CREATED_A
------------------------------ ---------- ---------
CU-1001              MEERA                IYER
meeraiyer@nailverse.com         9876543210 14-FEB-23

CU-1002              KAVYA                RAO
kavya.rao@gmail.com             8765432109 23-SEP-24
